Peer Review From Saadiyah Husnoo
(Saadiyah@mit.edu)

Hyuglim (Jonathan):

Jonathan is a great programmer and was very excited to learn and apply new technologies. He readily researched the potential external API's we could use and identified issues early. He was the life of our coding parties and knew how to entertain the people around to reduce stress when we were having trouble debugging. He was also quite helpful in finding weird behaviors or areas we could improve the app on, by visiting the whole app and picking up changes we should make, for example: he identified that our emailing feature was sending out the old (and broken) link to our project! Thus, he was also a great tester for our app.

Mukushev(Dana):

Dana is a team member you can count on. She would send reminders about upcoming deadlines and meetings and would always contribute to the project whether she was having a busy week or not. She was very easy to work with and we did a lot of coding jointly, especially in writing the bet/ milestone modules. She also researched on inconsistent behavior. For example, she discovered that a method was causing bugs, and what the bug was bug with the mongoose method itself. She also contributed to make the app look pretty and was very open to each team member's ideas and opinions.

Zulsar(Zulsar):

Zulsar is a great coder and team player. She put a lot of effort in debugging our code when unexpected behavior was occurring, especially when we were refactoring the code to avoid callback hells. She also, contributed a lot to the client-side, together with Jonathan and handled most of the communication with Venmo, to try and get our app approved. Sadly, that part of the code had to be removed, but she put in a lot of effort nevertheless. She was very dependable and wrote well-documented code, so that when we were implementing other parts of the project, we could understand what each function was doing.
